## Patent Application of Jerry S. Trainello - Page 9

Claims: I claim:

- 1. A pivotable putter head comprising:
  - a shaft;
  - a front face, a rear face, a topside, a bottom side, a front and backside and a bore on said pivotable putter head approximately center,
  - (a) a rotatable member rotatably disposed within said bore,
  - (b) structural means for securing said shaft on the top end of said rotatable member,
  - (c) structural means for securing said rotatable member in said bore at the bottom end,
  - (d) structural means for adjusting drag or tension on said rotatable member, whereby when striking a ball off-center with said pivotable putter head, said pivotable putter head would move or rotate only when hit,
- 2. The pivotable putter head as described in claim 1 further including viewable indicia on said rotatable member.
- 3. The pivotable putter head as described in claim 1 further including viewable indicia on said pivotable head.
- 4. The pivotable putter head as described in claim 2 further including a position indicator; wherein said position indicator is located at the top end on said rotatable member.

- 5. The pivotable putter head as described in claim 3 further including a position indicator; wherein said position indicator is located on the topside of said pivotable putter head.
- 6. The pivotable putter head as described in claim 4 and 5 wherein said position indicator on said rotatable member is in line with said position indicator on said pivotable putter head.
- 7. The pivotable putter head as described in claim 1 and claim 5 whereby said position indicator on said pivotable putter head and said pivotable putter head could rotate around the axis of said shaft.
- 8. The pivotable putter head as described in claim 1 and claim 4 whereby said position indicator on said rotatable member secured to said shaft could rotate around the axis of said pivotable head.
- 9. The pivotable putter head as described in claim 1 whereby when hit off-center said pivotable putter head would move.
- 10. A method of swiveling a club head, comprising:
  - (a) providing a head and shaft structurally connected so as to be rotatably disposed and to move or rotate when a golf ball is struck off-center; whereby said head has structural means to provide viewable indicia to indicate how much said head rotates, thereby visually making the golfer aware of where on the club head the ball hit.
